Mighty Mouse Final

Overall, the final mouse turned out ok. The size is a lot better than the first prototype: the harsh edges are rounded out; it is big enough to fit the pcb inside now and looks nicer. However, in this version, I did not leave enough room for the scroll wheel to move freely, sometimes it can get stuck on the mouse triggers. Also, I did not sand as much as I should have. It felt really smooth and nice when I got done sanding, but once I put some primer on, it revealed a lot of imperfections. I tried to make a gradient finish, which I think turned out pretty good. However, when I was gluing the top piece on, I got some glue stuck to my finger and pulled a piece of the paint off. Overall, the mouse is very comfortable and feel nice to use. The small problems are the scroll wheel clearance and some minor surface problems.
